

“How can Robots Help us in the Future?”

We have an interactive activity at our booth. We will be letting people drive an ollie through a maze created by our group. An ollie is a robot that you can control with an app on your phone. You will be learning about many things such as, how robots can help us in the future, about the arduino board, artificial intelligence and much more. We are in the process of building a robot and We have a model of a first aid kit robot. The way the first aid kit robot can help us in the future is by being able to help people who are in need of medical care. We learned that robots can help us in the future and already have in many ways. On our tri-fold, you will see some other ways robots can help us in the future, as well as more important information we found through research.
